Spike / Feasibility — [Project name]

Field	Entry
Project	[Project name]
Document	Spike / Feasibility
Version	[1.0]
Based on	BRD v[x.x], Gap Analysis v[x.x]
Date	[YYYY-MM-DD]
Author	[Name]
Status	Planned / Running / Complete

Workflow step: 3. Spike / feasibility. **Next step:** 4. Development (Go) or back to 1. BRD (rework).

1. Verdict

Guidance: write this last. One sentence answer, then what is proven and what is not.

[Feasible / Feasible with changes / Not feasible]. [One sentence why.]

- **Proven:** [ ]
- **Still unproven:** [ ]
- **BRD changes needed:** [ ]

2. Scope, timebox and test setup

- **Timebox:** [n] working days, [n] people. Stop when the go / no-go rules can be applied.
- **In the spike:** [what is built or tested]
- **Not in the spike:** [what is left for development]

Test environment

ID	Machine / environment	Purpose
E-1	[ ]	[Recommended setup]
E-2	[ ]	[Minimum setup]

Test data

ID	Data / sample	Why
D-1	[ ]	[Baseline]
D-2	[ ]	[Hard case]

3. Options and licence check

Component	Option	Licence (checked [YYYY-MM-DD])	Commercial use	Result
[ ]	[ ]	[ ]	Yes / No	Chosen / excluded

4. Experiments

Guidance: one row per question from the gap analysis. Each experiment names its fallback, so a failure leads to a decision rather than a debate.

#	Experiment	Pass condition	If it fails	Result
X1	[End-to-end run]	[Measurable]	**Rework** to step 1	

#	Experiment	Pass condition	If it fails	Result
X2	[Quality of option A vs B]	[Score ≥ n]	[Use option B / fallback]	
X3	[Performance]	[Time ≤ n]	[Reduce scope / raise hardware]	
X4	[ ]	[ ]	[ ]	

5. Prototype

Item	Description
Code location	[Repository / folder]
What it does	[ ]
How to run	[Steps or command]
What was tested	[ ]
Known limits	[ ]

6. Go / no-go rules

Outcome	Decision
All "rework" experiments pass	**Go** to step 4, Development
A "rework" experiment fails after one tuning retry	**Rework:** back to step 1 (see Rework Plan)
Only experiments with a fallback fail	Go, with the fallback written into the BRD
2 rework loops on the same experiment	Product owner decides: reduced release or not feasible

7. Re-spike for change requests

Guidance: used when UAT feedback or a change request needs a new technical approach (see Feedback and Change Management).

1. **Scope:** change request ID, component, evidence that triggered it.
2. **Timebox:** [3] days per component; [5] if adding a new tool or model.
3. **Candidates:** at most 3, each checked for licence and constraints before testing.
4. **Experiment:** reuse the matching experiment above, plus the case where the problem appeared.
5. **Pass:** meets the original pass condition **and** fixes the reported problem; no regression in the end-to-end and performance experiments.

Re-spike log

Change request	Date	Component	Candidates	Winner	Results	Decision
